TVB1440
SLASE51A – NOVEMBER 2014 – REVISED NOVEMBER 2014

TVB1440 4-Channel Video Re-Driver with Equalization
## ECCN: 3E991

1 Features

- Compatible with TV Aggregated Video Signaling Electricals
- Compatible to FPD Link 2 Interface
- Suited for Digital TV Chipset and TCON Boards
- Quad Channel Re-Driver Supporting Data Rates from 600 Mbps to 5 Gbps
- 3.3 V and 1.1 V Supply for Low Power Operation
- 175 mW Active Power Consumption for 4 Lane Operation
- 2 mW Shutdown Power
- Highly Configurable Input Equalization with 8 Control Settings
  - 0 dB to 15 dB
- 4 Pre-Emphasis Control Settings
  - 0, 3, 6 and 9 dB
- 4 Output Voltage Swing Control Settings
  - 350, 500, 700 and 1000 mV
- I^2C Control to Configure the Device for Optimum Performance
- Extended Temperature Range of -40°C to 85°C
- 2 kV HBM and 500 V CDM ESD Protection
- 48-pin QFN 7 mm x 7 mm package.

2 Applications

- Digital Television
- Camera
- Video Interfaces Requiring Large Throughputs

3 Description

TVB1440 is a 4 channel re-driver signal conditioner for TV applications allowing signal integrity between TV chipset and TCON boards. I^2C control provides the wide ranges of flexibility to configure the device for optimal signal conditioning so that video data link between a source and sink can achieve high fidelity. TVB1440 allows larger distance between a video source and sink device through its excellent jitter cleaning capability.
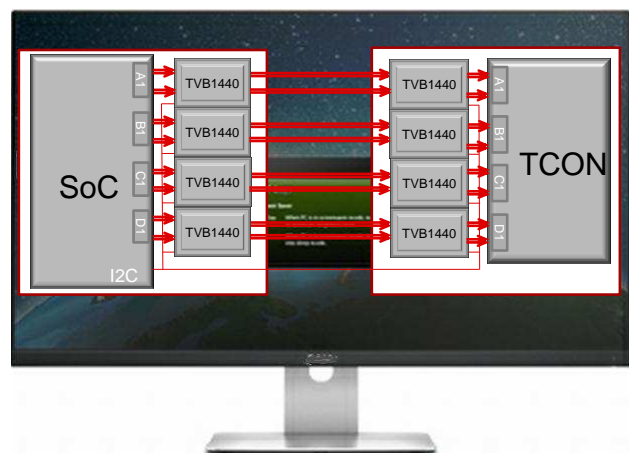

It has selectable control for receive equalization accessible through I2C to compensate for large trace or cable loss at its input resulting improved eye at the output signals. Transmitter in each channel has 4 levels of pre-emphasis and 4 levels of output voltage swing settings which enable optimum video signal performance from the TVB1440 to downstream receiver.

The TVB1440 is optimized for power conscience applications. Apart from its low active power, TVB1440 contains activity detection circuitry on the data link input that transitions to a low-power output disable mode in the absence of a valid input signal. This activity detect circuit can be disabled if desired. The device also has a shutdown mode when exercised results in 2mW.

Pin Functions

PIN			DESCRIPTION
SIGNAL	NO.	I/O	
DATA LANES PINS			
IN0p, IN0n	38, 39	Input (100Ω diff)	Lane 0 Differential Input
IN1p, IN1n	41, 42		Lane 1 Differential Input
IN2p, IN2n	44, 45		Lane 2 Differential Input
IN3p, IN3n	47, 48		Lane 3 Differential Input
OUT0p, OUT0n	23, 22	Output (100Ω diff)	Lane 0 Differential Output
OUT1p, OUT1n	20, 19		Lane 1 Differential Output
OUT2p, OUT2n	17, 16		Lane 2 Differential Output
OUT3p, OUT3n	14, 13		Lane 3 Differential Output
CONTROL PINS			
ADDR	3	3-level Input	I^{2}C Target Address Select.
EN	26	I	Device Enable. This input incorporates internal pullup of 200 kΩ.
NC	7, 40, 46		No Connect. These terminals may be left un-connected, or connect to GND.
RSTN	35	I	Active Low Device Reset. This is 1.1V input. This input includes a 150kΩ resistor to the V_{DDD} core supply. An external capacitor to GND is recommended on the RSTN input to provide a power-up delay. This signal is used to place the TVB1440 into Shutdown mode for the lowest power consumption. When the RSTN input is asserted, all outputs are high-impedance, and inputs are ignored; all I^{2}C registers are reset to their default values. At power up, the RSTN input must not be de-asserted until the V_{CC} and V_{DD} supplies have reached at least the minimum recommended supply voltage level.
RSVD1	10	I	Reserved pins. Please connect the pin to GND through 1K resistor.
RSVD2	11	I	Reserved pins. Please connect the pin to VCC through 1K resistor.
RSVD3	27	I	Reserved pins. Please connect the pin to VCC through 1K resistor.
RSVD4	28	I	Reserved pins. Please connect the pin to GND through 1K resistor.
SCL_CTL SDA_CTL	4 5	I/O	Bidirectional I2C interface to configure TVB1440. This interface is active independent of EN input but inactive when RSTN is low.
TEST1-6	8, 9, 29, 30, 33, 34		Test Outputs. Do not connect.

Pin Functions (continued)

PIN			DESCRIPTION
SIGNAL	NO.	I/O	
SUPPLY AND GROUND PINS			
GND	18, 24, 31, PAD		Ground. Reference GND connections include the device package exposed thermal pad.
VDD	2, 6, 12, 15, 21, 25, 32, 37, 43		Low voltage supply for analog and digital core. Nominally 1.1V
VCC	1, 36		3.3V Supply

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) [1]

		MIN	MAX	UNIT
Supply voltage	VCC	−0.3	4	V
	VDD	−0.3	1.3	
Voltage range	HS Link I/O (OUTx, INx) Differential Voltage	−0.3	1.3	V
	RSTN	−0.3	1.3	
	SCL_CTL, SDA_CTL, ADDR, EN	−0.3	4	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 Handling Ratings

		MIN	MAX	UNIT
T_{STG}	Storage temperature range	-65	150	·C
Electrostatic discharge	Human body model (HBM)[1]	−2000	2000	V
	Charged-device model (CDM)[2]	−500	500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	TYP	MAX	UNIT
VCC	Supply Voltage, IO	3		3.6	V
VDD	Supply Voltage, CORE	1		1.26	V
V_{IH}	High-level input voltage for ADDR, EN	1.9		3.6	V
V_{IL}	Low-level input voltage for ADDR, EN	0		0.8	V
$V_{IH,RSTN}$	High-level input voltage for RSTN (typical hysteresis of 80mV)		0.75		V
$V_{IL,RSTN}$	Low-level input voltage for RSTN (typical hysteresis of 80mV)		0.3		V
T_A	Operating free-air temperature	0		85	°C
f_{scl}	I2C CK frequency at SCL_CTL (standard I2C mode[1])			100	kHz

(1) The local interface through SCL_CTL and SDA_CTL should follow standard mode I2C specifications

TVB1440
SLASE51A –NOVEMBER 2014–REVISED NOVEMBER 2014

7.4 Thermal Information

THERMAL METRIC[1]		TVB1440	UNIT
		RGZ (48 Pin)	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	35.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	21.5	
$R_{\theta JB}$	Junction-to-board thermal resistance	11.7	
ψ_{JT}	Junction-to-top characterization parameter	1.2	
ψ_{JB}	Junction-to-board characterization parameter	11.9	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	6.7	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

7.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	TYP	MAX	UNIT
I_{CC}	Supply current 4 lanes operation[1]		130	230	mA
I_{STDN}	Shutdown supply current[1]		1.5	3	mA
I_{OD}	Squelch (output disable) supply current		35	50	mA
V_{OD0}	Output differential voltage swing	238	340	442	mVpp
V_{OD1}		357	510	663	
V_{OD2}		484	690	897	
V_{OD3}		700	1000	1300	
PE_0	Output pre-emphasis		0		dB
PE_1			3		
PE_2			6		
PE_3			9		
R_{OUT}	Driver output impedance		50		Ω
$I_{(TXSHORT)}$	Output pins short circuit current limit			50	mA
$V_{(SQUELCH)}$	Squelch threshold voltage for input signals (default)		80		mVpp

(1) Values are V_{DD} supply measurements; VCC supply measurements are 5 mA (typical) and 8 mA (max), with zero current in shutdown mode.

7.6 Timing Requirements

|		MIN	TYP	MAX	UNIT
t_{ramp1}	Time V_{DD} must stable before V_{CC} is applied	10			µS
t_{ramp2}	Time RSTN must remain asserted until V_{CC}/V_{DD} voltage has reached minimum recommended operation	100			µS
t_{ramp3}	Time device will be available for operation after a valid reset	400			mS

8 Detailed Description

8.1 Overview

TVB1440 is a 4 channel HS re-driver signal conditioner for TV applications. I2C control provides the wide ranges of flexibility to configure the device for optimal signal conditioning so that video data link between a source and sink can achieve high fidelity. TVB1440 allows larger distance between a Chipset and TCON boards through its excellent jitter cleaning capability.

The TVB1440 is optimized for power conscience applications. Apart from its low active power, TVB1440 contains activity detection circuitry on the data link input that transitions to a low-power output disable mode in the absence of a valid input signal. This activity detect circuit can be disabled if desired. The device also has a shutdown mode when exercised results in 2 mW.

The TVB1440 receiver and driver provide input and output common mode voltage bias. It is required that both receive and transmit end of the device is ac coupled in application use cases. Suggested value for the ac coupling capacitors is 75-200 nF.

8.2 Functional Block Diagram
8.3 Feature Description

8.3.1 Equalization

TVB1440 provides flexible continuous time linear equalization (CTLE) to compensate for large trace or cable loss at its input resulting improved eye at the output signals. It has selectable control for receive equalization accessible through I^{2}C.

8.3.2 Configurable Output

Transmitter in each channel has 4 levels of pre-emphasis and 4 levels of output voltage swing settings which enable optimum video signal performance from the TVB1440 to downstream receiver.

8.3.3 Squelch

TVB1440 has active Squelch feature that allows automatic shutdown of output drivers when it does not have valid input signal. The feature can be disabled through I2C if not desired.

8.4 Device Functional Modes

8.4.1 Active Mode

Normal operation mode. The data lanes of TVB1440 work normally.

8.4.2 Shutdown Mode

Device is in lowest power mode. This mode is invoked by de-asserting RSTN or EN low.

8.4.3 Squelch Mode

The device does not have valid input signal. Output drivers are turned off.

8.5 Programming

8.5.1 Local I^{2}C Interface

It is required to use the TVB1440's local I^{2}C interface to configure the TVB1440's receivers (IN[3:0]P/N) and transmitters (OUT[3:0]P/N). The TVB1440's internal registers are accessed through the SCL_CTL pin and SDA_CTL pin. The 7-bit I^{2}C slave address of the TVB1440 is determined by the ADDR pin.

Table 1. TVB1440 I^{2}C Slave Address Options

ADDR	7-BIT I^{2}C SLAVE ADDRESS	READ SLAVE ADDRESS	WRITE SLAVE ADDRESS
Low (VIL)	7'b0101100	'h59	'h58
V$_{CC}$/2 (VIM)	7'b0101101	'h5B	'h5A
High (VIH)	7'b0101110	'h5D	'h5C

Before adjusting the TVB1440's registers, a writing a zero to bit 2 of address 04h is required to enable the receiver and transmitter adjustments.

Product Folder Links: TVB1440

8.5.2 Receiver (IN[3:0]P/N) Adjustments

8.5.2.1 Equalization Level

It is recommended to use the TVB1440 local I^{2}C interface to configure the TVB1440 receiver equalization level. Software should then enable equalization control by writing a one to EQ_I2C_ENABLE bit (bit 7 at address 05h). After EQ_I2C_ENABLE is set, then software can program the equalization for each lane (IN[3:0]) to the appropriate value. Refer to Table 2 for details on equalization settings for each lane.

Table 2. TVB1440 Equalization Levels

Address	Bits(s)	Description	Access
04h	2	Receiver and transmitter adjustment. 0 – configure receiver and transmitter using I2C (required) 1 – reserved (default)	RW
05h	2:0	EQ_LEVEL_LANE0. This field selects the EQ gain level for Lane 0 (IN0P/N). 000 – 0 dB 001 – 2 dB (3.75Gbps); 2.5 dB (5Gbps) 010 – 3.5 dB (3.75Gbps); 5 dB (5Gbps) 011 – 5 dB (3.75Gbps); 6 dB (5Gbps) 100 – 6.5 dB (3.75Gbps); 8 dB (5Gbps) 101 – 8 dB (3.75Gbps); 11 dB (5Gbps) 110 – 9.5 dB (3.75Gbps); 13 dB (5Gbps) 111 – 12 dB (3.75Gbps); 15 dB (5Gbps)	RW
05h	7	EQ_I2C_ENABLE. This field allows EQ control through I2C 0 – reserved (default) 1 – EQ level is set by I2C (required)	RW
07h	2:0	EQ_LEVEL_LANE1. This field selects the EQ gain level for Lane 1 (IN1P/N. Bit definition identical to that of EQ_LEVEL_LANE0.	RW
09h	2:0	EQ_LEVEL_LANE2. This field selects the EQ gain level for Lane 2 (IN2P/N). Bit definition identical to that of EQ_LEVEL_LANE0.	RW
0Bh	2:0	EQ_LEVEL_LANE3. This field selects the EQ gain level for Lane 3 (IN3P/N. Bit definition identical to that of EQ_LEVEL_LANE0.	RW

8.5.2.2 Squelch Level

The TVB1440 squelch level defaults to 80mVpp. If it is necessary to adjust the squelch level, it can be done by changing the SQUELCH_SENSITIVITY register located in the TVB1440's Local I2C register space.

Table 3. Squelch Sensitivity Levels

Address	Bits(s)	Description	Access
03h	5:4	SQUELCH_SENSITIVITY. Main link squelch sensitivity is selected by this field, and determines the transitions to and from the Output Disable mode. 00 – Main Link IN0P/N squelch detection threshold is set to 40mVpp. 01 – Main Link IN0P/N squelch detection threshold is set to 80mVpp. (Default) 10 – Main Link IN0P/N squelch detection threshold is set to 160mVpp. 11 – Main Link IN0P/N squelch detection threshold is set to 250mVpp.	RW
	3	SQUELCH_ENABLE. 0 – Main Link IN0P/N squelch detection is enabled (default) 1 – Main Link IN0P/N squelch detection is disabled.	RW

8.5.3   Main Link Output [OUT[3:0]P/N] Adjustments

The TVB1440 Main link outputs (OUT[3:0]) must be set in link address space by following specified I^{2}C access method.

8.5.3.1   LINK Address Space

Access to and from the TVB1440 LINK address space is indirectly addressable through the local I^{2}C registers as illustrated in the Figure 8.
Figure 8.   Accessing TVB1440 LINK Registers

The configuration of these registers can be performed through the local I^{2}C interface, where three registers (from 1Ch to 1Eh) are used as the address to the LINK register and another one (1Fh) as a data to be read/written.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

TVB1440 is a signal conditioner especially suited for equalizing channel loss due to traces and flexible cable between digital TV chipset and TCON receiver.

9.1.1 Typical Application

The device can be helpful improving eye diagram by placing it either end of the flexible cable in digital TV chipset or TCON board or at the both. Figure 9 shows a typical application for TV interface.
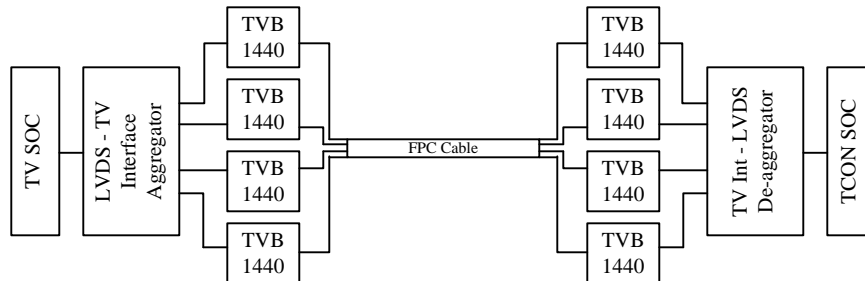

Figure 9. Typical Application of TVB1440 in 4K2K Digital TV Interface

9.1.1.1 Design Requirements

Table 5. Design Parameters

PARAMETER	VALUE
V_{DD} Supply	1.1 V
V_{CC} Supply	3.3 V
TV Max Resolution Requirement	
Pixel Clock (MHz)	1194
Horizontal Active (pixels)	3840
Vertical Active	2160
Color bit Depth (6bpc, 8bpc, 10bpc)	10 (30 bpp)
Refresh Rate	120 Hz
Panel Configuration (A or B)	B
Channel Requirements	
Input Channel Insertion Loss	Up to 12 dB at 3.75 Gbps
Output Channel Insertion Loss	Up to 12 dB at 3.75 Gbps
TVB1440 Settings	
Number of Lanes (1, 2, or 4)	4
Link Rate (Gbps)	3.75
RX EQ Setting (dB)	6.5 dB
TX VOD Setting (Level 0, 1, 2, or 3)	Level 3 (1000 mVpp)
TX Pre-Emphasis Setting (Level 0, 1, 2, or 3)	Level 0 (0 dB)

![Texas Instruments logo]

9.1.1.2 Detailed Design Procedure

9.1.1.2.1 Common 4k2k TV Panel Configuration

A common 4k2k TV is broken into four 1920 x 1080 panels or four 960 x 2160 panels. For this particular implementation, panel configuration B is assumed. It is also assumed that two TVB1440 are used for each panel (one near SOC and one near TCON) for a total of eight TVB1440.

Figure 10. Common Panel Configurations

9.1.1.2.2 1Max Stream Rate

The maximum stream rate can be derived from the maximum TV resolutions pixel clock and color depth. For this example, the maximum pixel clock is 1194 MHz. Because the TV is broken into 4 panels, the actual pixel clock for each panel is 298.5 MHz.

Stream Bit Rate = PixelClock x bpp

Stream Bit Rate = 298.5 x 30

Stream Bit Rate = 8.955 Gbps.

9.1.1.2.3 Encoded Stream Rate

Most high-speed video standards are 8b10b encoded. Because of 8b10b encoding overhead, an additional 20% must be added to the stream bit rate. On top of the 8b10b, there are some additional overhead due to packetization before the 8b10b encode that also must be added to the stream bit rate. For example, a particular video standard may define the actual coded stream rate by the following equation.

Encoded_Stream_Rate = #_of_Bytes_for_bpp x 8 x 1.25 x PixelClock

Encoded_Stream_Rate = #_of_Bytes_for_bpp x 8 x 1.25 x PixelClock

Encoded_Stream_Rate = 11.94Gbps.

9.1.1.2.4 TVB1440 Configuration

The TVB1440 must be configured by the SOC using I2C. Because of the limited number of I2C address available on the TVB1440, an I2C switch needs to be incorporated in order to configure each of the TVB1440. Figure 11 shows an example implement using the Texas Instruments TCA9546A 4-channel I2C switch.

TCA9546A I2C address options:
7'b1110XYZ where X = A2, Y= A1, Z = A0
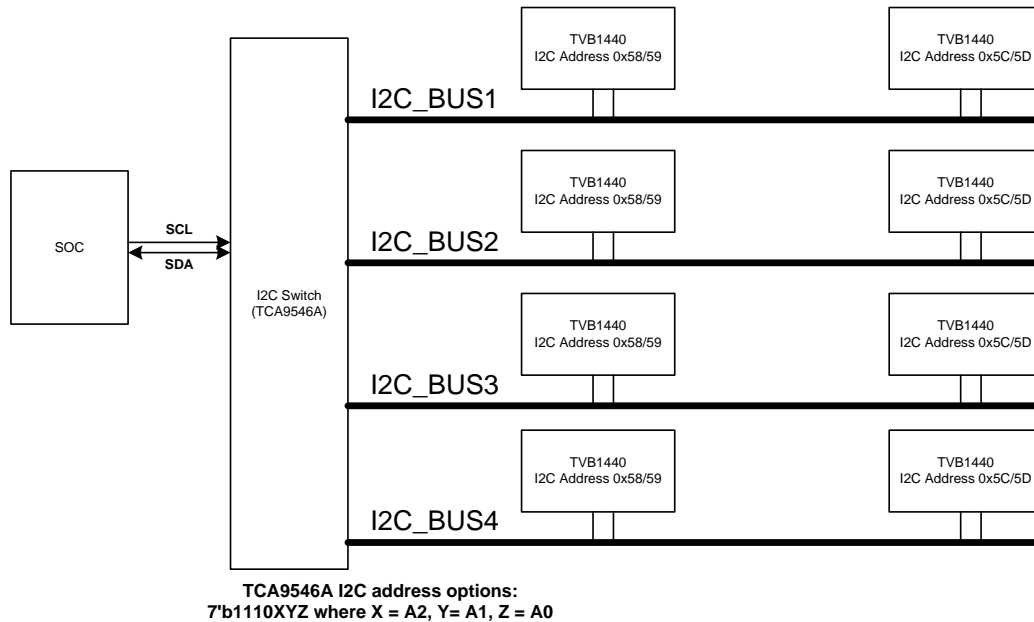

Figure 11. Example I2C Switch Implementation

9.1.1.2.5 Receiver Equalization Setting

The TVB1440 has a receiver equalizer that is adjustable from 0dB to 15 dB at 5 Gbps. The common approach to determine the proper equalizer setting is to measure the insertion loss of the channel at the input of the TVB1440 at the Nyquist frequency of the data rate (1.875 GHz for 3.75 Gbps and 2.5 GHz for 5 Gbps). For example, if the input channel is 20 inches of trace with 4 mil width over FR4, the insertion loss at 3.75 Gbps would be -7.3 dB and at 5 Gbps would be -9.1 dB. The register EQ_LEVEL_LANEx, where X = 0, 1, 2, or 3 should be programmed to 3'b100 for a 3.75 Gbps data rate and should be programmed to 3'b101. The actual setting may need to be adjusted based on the additional channel parasitics from package, vias, and connectors.
m1 frequency = 1.876 GHz I_L = −7.346
m2 frequency = 2.500 GHz I_L = −9.185

Figure 12. Insertion Loss of 20 Inch FR4 Trace With 4-mil Width

9.1.1.2.6 Transmitter Settings

The TVB1440's transmitter controls have four settings for voltage swing and four settings for pre-emphasis. The best transmitter setting to use is a function of the output channel insertion loss and the inputs eye requirement of the device at end of the channel. For the case in which a TVB1440 is at the end of the channel, the output channel's insertion loss should not be greater than the receiver equalization of the TVB1440.

To specify the largest eye opening at the end of the channel, the best voltage swing setting should be either level 2 or level 3. It is also recommended to use either a pre-emphasis level of 0 dB or 3dB. The pre-emphasis setting can be thought of as a way to reduce the amount receiver equalizer required by the device at end channel. For example, a 3.5dB setting could allow for the receive equalization setting for the TVB1440 to be reduced from 12dB to 10dB. If necessary, these settings can be adjusted up or down in order to improve the eye opening at the end of the channel.

9.1.1.2.7 RESET

The TVB1440 RSTN input gives control over the device reset and to place the device into shut-down mode. When RSTN is low, all registers are reset to their default values, which means all HS Link ports are disable. When the RSTN pin is released back to high, the device comes out of the shut-down mode. To turn on the HS Link, it is necessary to provision the device registers through the local I^2C_CTL interface.

It is critical to transition the RSTN input from a low to a high level after both V_{CC} and V_{DD} supply voltages have reached the minimum recommended operating voltage. This is achieved by a control signal to the RSTN input, or by an external capacitor connected between RSTN and GND. To insure that the TVB1440 is properly reset, the RSTN pin must be de-asserted for at least 100 µs before being asserted.

The RSTN input includes a 150k resistor from the input to the V_{DD} supply. An external capacitor connected between RSTN and GND allows delaying the RSTN signal during power up. When implementing the external capacitor the size of the external capacitor depends on the power up ramp of the VCC and VDD supplies; a slower ramp-up results in a larger value external capacitor. Approximately 200 nF capacitor is a reasonable first estimate for the size of the external capacitor for most applications.

Both RSTN implementations are shown in Figure 13.

**Figure 13. (a) Reset Implementation Using a Capacitor, (b) Microprocessor Drives the Pin**

Figure 14 shows a typical schematic implementation either in TV chipset or TCONS receiver board.

Figure 14. Schematic Implementation of TVB1440

10 Power Supply Recommendations

The following power-up and power-down sequences describe how the RSTN signal is applied to the TVB1440.

10.1 Power-Up Sequence

1. Apply VDD then VCC (recommended both less than 10-ms ramp time). VDD must be asserted first and stable for greater than 10 µs before VCC is applied.

2. RSTN must remain asserted until VCC/VDD voltage has reached minimum recommended operation for more than 100 µs.

3. De-assert RSTN (Note: This RSTN is a 1.1V interface and is internally connected to VDD through a 150-kΩ resistor).

4. Device will be available for operation approximately 400 ms after a valid reset.
Figure 15. Power-up Sequence

10.2 Power-Down Sequence

There is no power-down sequence required.

11 Layout

11.1 Layout Guidelines

11.1.1 Differential Pairs

This section describes the layout recommendations for all the TVB1440 differential pairs: IN[3:0] and OUT[3:0].

- Must be designed with a differential impedance of 100 Ω ± 10% or 50-Ω single-ended impedance.
- In order to minimize cross talk, it is recommended to keep high speed signals away from each other. Each pair should be separated by at least 5 times the signal trace width.
- Route all differential pairs on the same layer adjacent to a solid ground plane.
- Do not route differential pairs over any plane split.
- Adding test points causes impedance discontinuity and; therefore, negative impacts signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes stub on the differential pair.
- Avoid 90 degree turns in trace. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be ≥ 135 degrees. This minimizes any length mismatch causes by the bends; and therefore, minimizes the impact bends have on EMI.
- Minimize the trace lengths of the differential pair traces. Longer trace lengths require very careful routing to assure proper signal integrity.
- Keep intra-pair skew to a minimum in order to minimize EMI. There should be less than 5 mils difference between a differential pair signal and its complement.
- Minimize the use of vias in the differential pair paths as much as possible. If this is not practical, make sure that the same via type and placement are used for both signals in a pair. It is recommended to keep the vias count to 2 or less.

11.1.2 Layout Example
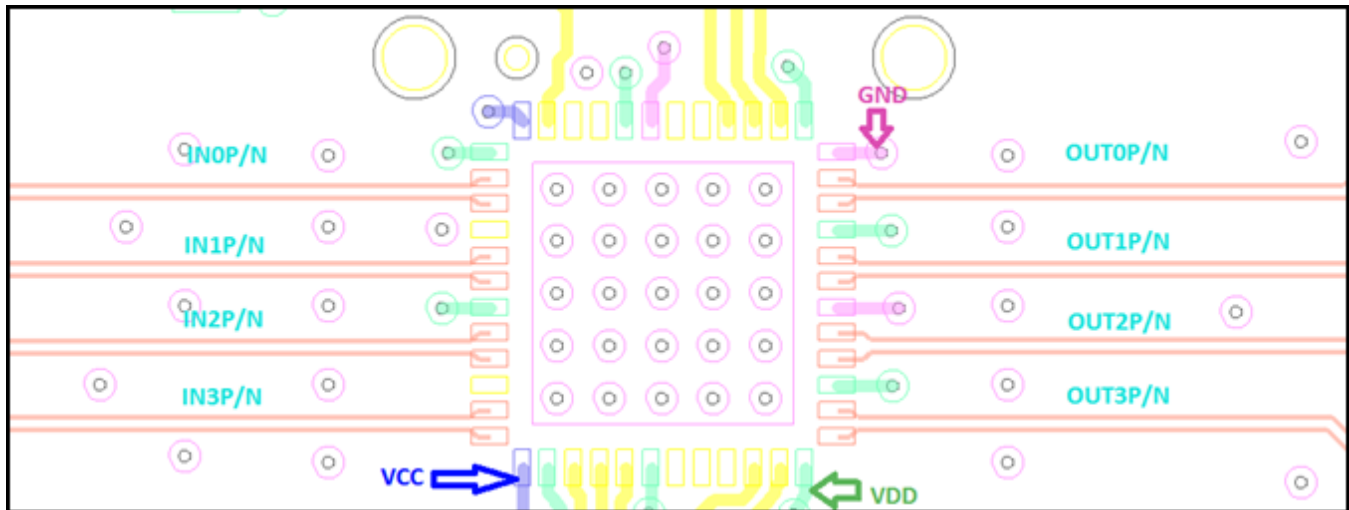

Figure 16. TBV1440 Layout

Layout Guidelines (continued)

11.1.3 Placement

- A 100-nF should be placed as close as possible on each V_{DD} and V_{CC} power pin.
- The 100-nF capacitors on the IN[3:0] and OUT[3:0] nets should be placed close to the connector.
- The ESD and EMI protection devices (if used) should also be placed as possible to the connector.

11.1.4 Package Specific

- The TVB1440 package as a 0.5 mm pin pitch
- The TVB1440 package has a 4.1 mm x 4.1 mm thermal pad. This thermal pad must be connected to ground through a system of vias.
- All vias under device, except for those connected to thermal pad, should be solder masked to avoid any potential issues with thermal pad layouts.

11.1.5 Ground

It is recommended that only one board plane be used in the design. This provides the best image plane for signal traces running above the plane. The thermal pad of the TVB1440 should be connected to this plane through a system of vias.

12   Device and Documentation Support

12.1   Trademarks

All trademarks are the property of their respective owners.

12.2   Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.3   Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

12.4   Glossary

SLYZ022 — *TI Glossary*.
     This glossary lists and explains terms, acronyms, and definitions.

13   Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TVB1440RGZR	ACTIVE	VQFN	RGZ	48	2500	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	0 to 85	TVB1440	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

RGZ (S−PVQFN−N48)   PLASTIC QUAD FLATPACK NO−LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No−Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
