THE MAX CLIP SYSTEM™ CLIP SOLUTIONS ONLY LIMITED BY THE IMAGINATION

The Max Clip System is approved by leading providers of power semiconductors, including: Advanced Power Technology, International Rectifier, STMicroelectronics, and IXYS

APT Advanced Power Technologies manufactures high power, high voltage, high performance power semiconductors for the internet, computers and high capacity mass storage products, wireless cellular base stations for telecommunications, advanced industrial, military and space applications.

International Rectifier is a global supplier of power semiconductors for power conversion. Its Hexfet MOSFETs are used in anti-lock braking and fuel injection systems, disk drives, printers, video cameras, power tools, electronic lighting ballasts, industrial test equipment, telephone networks/modems, and satellites.

STMicroelectronics is one of the world's leading suppliers of semiconductor integrated circuits and discrete devices. ST is especially focused on MPEG2 decoder ICs, smartcard MCUs, special automotive ICs and EPROM memories.

IXYS Corporation designs, develops and markets power semiconductors for controlling energy in motor drives, power conversion (UPS uninterruptible power supplies and SMPS switch mode power supplies), and medical electronics. IXYS focuses on high power semiconductors processing over 500 watts of power.

PLEASE NOTE: Our customers are reminded that they bear the responsibility for testing AAVID THERMALLOY products for proposed use. Any information furnished by AAVID Thermalloy is believed to be accurate and reliable, but our customers must bear all responsibility for use and applications of AAVID THERMALLOY products.

All AAVID THERMALLOY products are sold subject to the AAVID Domestic Terms and Conditions of Sale in effect from time to time, a copy of which shall be furnished upon request, and other conditions that may apply to specific products. This catalogue does not constitute an offer to sell.

The Max Clip System Advantages

Traditionally, the most common method for mounting a semiconductor to the heatsink has been through the use of rivets or screws. This approach ensures very high levels of reliability and, typically, good thermal interfaces. While such techniques are still commonplace throughout the industry, the advance in clip mounting technology and special thermal interface materials means that these solutions now not only offer the same (or improved) performance compared with screw and rivet designs but also a large number of other technical and manufacturing benefits. At the same time, the recent launch of devices where traditional rivet holes have been eliminated to improve functionality by increasing die carrying area, means that increasingly there is no alternative solution to mounting other than to use clips.

The economical and manufacturing benefits offered by clip solutions are readily apparent in that they allow for simplified and rapid automated or manual assembly offering reliable mounting without the problems sometimes associated with torque control of screws. For high-volume production, suitable jigs and high-speed pneumatic pistons will typically be used to locate the components and assemble the clip. Clip solutions can also simplify ongoing equipment maintenance as they are significantly easier to disassemble and reassemble than their rivet- and screw-based counterparts.

A well-designed clip solution will ensure that a largely homogeneous force is distributed across the surface of the component package and that pressure is placed on the centre of the component as this is the area that typically dissipates the most power. This eliminates the problem of components becoming tilted due to the non-axial pressure of a screw – a particularly common issue in cases where the component is mounted on some form of rubber insulating foil. Furthermore, if it is designed with suitable inherent flexibility and strong thermal hysteresis, then the good clip solution will also maximise reliability by ensuring a very low stress on the component throughout its operating life. And because the clip will provide a constant pressure over time, the use of clip mounting techniques eliminates the problems associated with screws loosening as a result of vibration. Finally, by using a good interface material which adapts and thins itself below the component, the clip can follow this movement to further guarantee maintenance of a steady and even pressure on the component.

By considering the points above, we can see that a well-designed clip solution will need to:

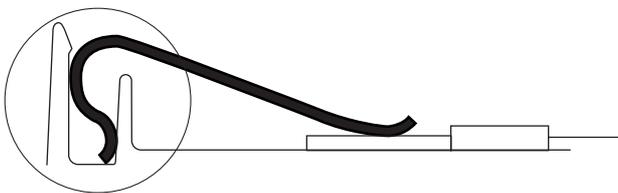

- Offer very high elasticity
- Be easy to assemble during manufacture
- Be easy to disassemble and re-assemble during operating life
- In most cases, offer high levels of resistance against corrosion
- Provide exactly the right pressure on the component according to the material interface used

The particular interface material chosen can have a significant effect on the performance of a given heatsink solution. In the past, such thermal interfaces have commonly been based on grease compounds as these offered the highest levels of thermal performance.

The key to the successful combination of clip solution and thermal interface material comes down to the pressure that needs to be applied to the particular component for optimal performance. Typically, with a good interface material such as Easy-ply™, Kon-Dux or a phase change material like Ultrastick, the ideal recommended pressure will be between 10 and 15 N/cm². Using a good insulating silicon rubber such as In-Sil-8™ is likely to require a pressure of 15 to 30 N/cm² depending on the

insulating thickness. It should be noted that increasing the pressure from the above parameters will give little improvement in overall thermal performance. As a rule of thumb, Aavid Thermalloy suggests that the optimum force on a TO220 device without an insulating interface be in the region of 20 N rising to 30 N with an insulating interface. In the case of TO247 devices, the suggested force would be 35 N and 55 N respectively.

Importantly, as with any other critical component, the heatsink, mounting technique and interface material required should be assessed at the earliest possible stage of the development process. Indeed, this is the only way to ensure an economical solution that is optimised to the given design in terms of the thermal and environmental conditions, any mechanical constraints and the final manufacturing process.

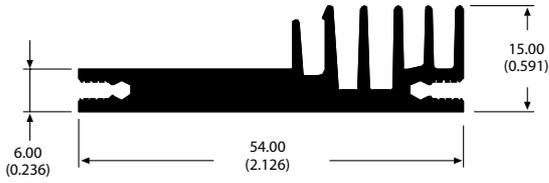

The MAX clip system comprises a proprietary reduced fin configuration incorporated into each heatsink, into which a clip is pressed for optimum retention.

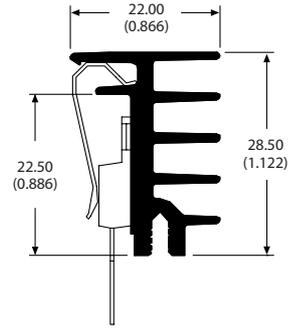

The MAX clip system is patented throughout Europe, North America and Asia
U.S. Patent # 5.991.151

How to order solderable pins

View from component side

The Max Clip System – patented

Standoff "S"

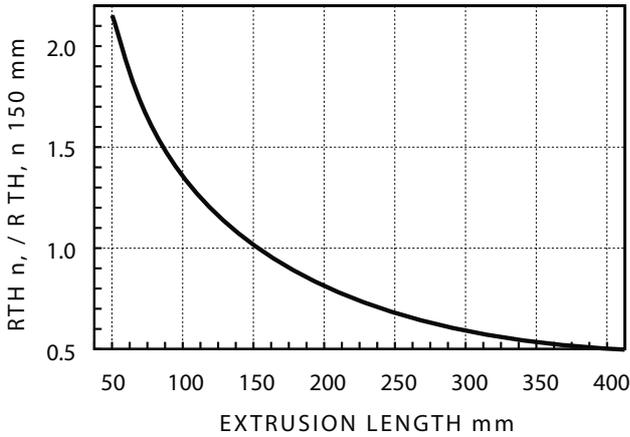

- Standard Standoff =
- 0 mm
 - 1 mm
 - 3 mm
 - 5 mm

The suggested hole dia. in the PCB is 2.7 ± 0.1 mm with a pitch tolerance of ± 0.15 mm

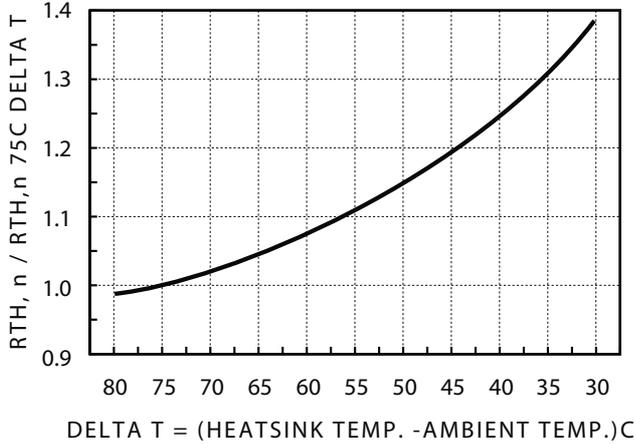

Dimensions "B" and "C" are not required for a heatsink with only 1 solderable pin
 Dimension "C" is not required for a heatsink with 2 solderable pins
 Tolerance ± 0.2 mm

NOTE: We suggest that soldering and mechanical resistance tests are made by customer before full production

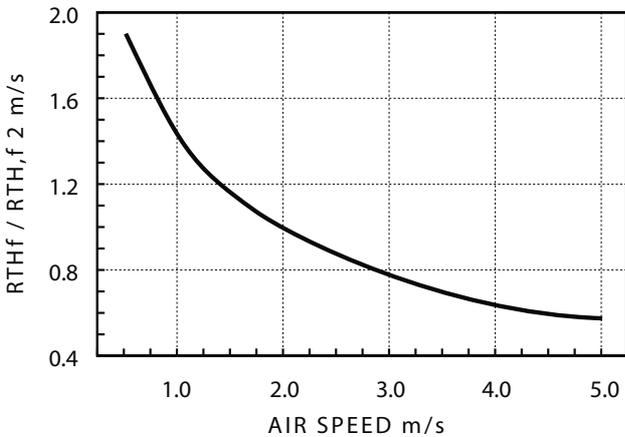

THERMAL RESISTANCE vs LENGTH

THERMAL RESISTANCE vs (Ts - Ta)

THERMAL RESISTANCE vs AIR SPEED

HOW TO INTERPRET THERMAL PERFORMANCE

The extrusions are presented in order by shape and size. Dimensions are in mm with (inches) following in parenthesis. On the previous page there is an index sorted by extrusion part number. The part number, weight in kg/m, thermal resistance ($R_{th,n}$ with natural convection, thermal resistance $R_{th,f}$ with forced convection) at an air speed of 2.0 m/s is shown for each extrusion. The thermal resistances have been calculated using 150 mm long vertical anodized heat sinks with a sink-to-ambient temperature difference of 75°C and a uniform thermal load on the heat sink base.

LENGTH CORRECTION FACTOR

Because the air heats up while circulating through the extrusion, the convection coefficient is not constant throughout the extrusion length. Therefore, the thermal resistance changes nonlinearly as the length changes. To calculate the correct thermal resistance for extrusion lengths other than the standard 150 mm length, multiply the given thermal resistance data by the appropriate factor taken from the Thermal Resistance vs Length graph shown. The same correction factor must be used for thermal resistance in both natural convection and forced convection.

TEMPERATURE CORRECTION FACTOR

Both natural convection and radiation coefficients are related to the sink-to-ambient temperature difference. To evaluate the thermal performance of a heat sink for an application requiring a sink-to-ambient temperature rise other than 75°C, use the correction factor from the Thermal Resistance vs (Ts - Ta) graph shown. This factor must be used only for thermal resistance in natural convection.

AIR SPEED CORRECTION FACTOR

The convection coefficient is also closely related to the air speed through the fins. Since evaluation of air speed through the fins is difficult to evaluate under normal circumstances, we show the thermal resistance of an extrusion in forced convection evaluated using a tunnel the same size as the extrusion. For a tunnel airflow other than 2 m/s, refer to the factor in the Thermal Resistance vs Air Speed graph shown. Use this factor to figure thermal resistance in forced convection.

SHOCK AND VIBRATION TESTING

Provided by PENNY + GILES • Test Certificate No. 3318

1. TEST CONDUCTED

1.1 Sine Vibration and 1/2 Sine Shock

2. SPECIMEN DATA

2.1 No. Off : 4 off
2.2 Identification : Heat sink S509/40 with MAX Clips retaining 4 off semiconductors
2.3 Reference No. : MAX 01 , MAX 02 , MAX 03 , MAX 04
2.4 Serial No.(s) : 1 , 2 , 3, and 4
2.5 Condition received : OK

3. SPECIFICATIONS AND/OR NATIONAL STANDARDS

3.1 Equipment Specification

3.1.1 Authority : N/A
3.1.2 Title : N/A
3.1.3 Issue : N/A
3.1.4 Data : N/A
3.1.5 Requirement/s : N/A

3.2 RELATED NATIONAL STANDARD

3.2.1 Authority : BSI
3.2.2 Title : BS2011
3.2.3 Issue : As date
3.2.4 Data : Test Ea: 1988, Test Fc: 1983.
3.2.5 Requirement(s) : Tests Ea and Fc, as modified by Request To Test form 3318

4. CLIENT

4.1 El.Bo.Mec Thermalloy - Via Del Tipografo, 4 - 40138 Bologna, Italy

5. RECEIPT OF TEST SPECIMEN

5.1 Specimen received 28.05.98 under request to test form No. 3318, dated 28.05.98.

6. DATE OF TEST

6.1 Test commenced and completed 01.06.98.

7. DISPOSAL OF TEST SPECIMEN

7.1 Specimen returned to client under delivery note 1362 dated 02.06.98.

8. TEST METHOD/PROCEDURE

8.1 The Heat Sink Assembly was mounted onto the shaker table and subjected to a sinusoidal vibration test as follows:

Frequency Range 8 Hz to 100 Hz
Vibration Amplitude $\pm 3g$ pk
Rate of Change of Frequency 1 Octave per minute
Test Duration 20 minutes

8.2 During the above 20 minute period the Heat Sink Assembly was observed visually for evidence of the MAX Mounts becoming detached.

8.3 The procedures described in 8.1 and 8.2 above were repeated such that vibration test was conducted in all three mutually perpendicular axes.

8.4 The Heat Sink Assembly was then subjected to a shock test as follows:

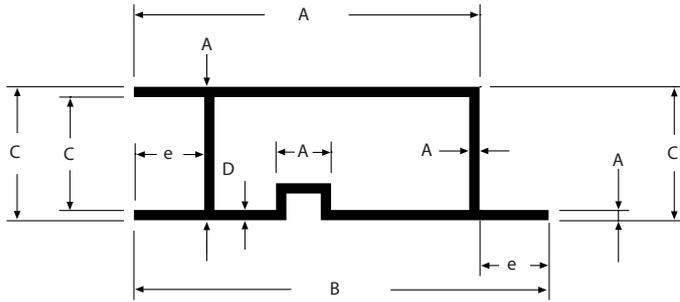

Shock Pulse Envelope 112 sine
Period 6 ms
Amplitude 5 g
Number of Shocks 3
Application 3 shocks per sense per axis

8.5 During the above 20 minute period the Heat Sink Assembly was observed visually for evidence of the MAX Mounts becoming detached.

9. TEST RESULTS

9.1 The MAX Clips did not break free from the Heat Sink Assembly. No physical degradation was observed.

OUR MISSION

Aavid Thermalloy will lead the electronics thermal management industry worldwide. We will be the first company customers call to enable their thermal designs anywhere in the world. We will respond with extraordinary speed and will provide them with timely and cost effective solutions because we understand their needs, their industry, and their culture.

About Aavid Thermalloy LLC

Aavid Thermalloy, LLC, a subsidiary of Aavid Thermal Technologies, Inc., is the world's leading provider of thermal management solutions. Founded in 1964 as Aavid Engineering, Aavid quickly established a reputation for excellence and in 1999 acquired Thermalloy, Inc. Today Aavid Thermalloy is the oldest and largest business devoted exclusively to thermal management of electronic systems. We have built an impressive track record by deploying world-class engineering resources that working directly with our customers to remove damaging heat from electronic equipment.

Aavid Thermalloy is the partner of choice for electronics companies focused on introducing next generation of products to market faster, with greater reliability, and increased functionality. Leading the way with the industries broadest line of standard products, Aavid Thermalloy is the most recognized heat sink manufacturer in the world. Our design capabilities extend beyond standard products and use the most advanced thermal engineering resources available to design application specific products. Aavid Thermalloy solutions cool critical electronic components in computers, transportation, communications infrastructure, power supplies, motor controls, power conversion equipment, and more.

From our headquarters located in Concord, New Hampshire and our locations around the globe, we develop and market innovative approaches to overcome the thermal challenges facing equipment designers in North America, Europe, and Asia. Our design resources and investment in advanced manufacturing technologies have positioned Aavid Thermalloy as The Total Integrated Solution for Cooling Electronics.

Customer Service

Anticipating customer needs and meeting them with the highest quality products and services in a timely and cost effective manner

World Wide Sales and Distribution Network

Support product development cycles with dedicated sales engineering resources and distribution partners that deliver on time, anywhere in the world

Design Assistance

Guiding our customers through thermal design issues at all stages of product development from concept to production with solutions that provide competitive advantage

World Class Manufacturing Processes

Delivering innovative quality products to market cost effectively using global resources and a broad portfolio of manufacturing processes and capabilities

Global Logistics Support

Integrate seamlessly into our customers supply chain and leveraging our global footprint to supply product quickly

Quality

Pursuing an approach to quality and reliability that is reinforced by a system promoting continuous improvement as part of our core culture. ISO 9001: 2000 certified

Aavid Thermal Technologies, Inc.

The Total Integrated Solution for Cooling Electronics®

Aavid Thermal Technologies, Inc., operates through its subsidiaries in three business areas—Thermal Management Solutions, Computational Fluid Dynamics (CFD) software and Customized Computer Aided Engineering (CAE). Each of these businesses has an established reputation for high product quality, service excellence and engineering innovation.

WWW.AATT.COM

Aavid Thermalloy, LCC is the partner of choice for electronics companies focused on introducing next generation products to market faster, with greater reliability, and increased functionality. Leading the way with the industries broadest line of standard products, Aavid Thermalloy is the most recognized heat sink manufacturer in the world. Our design capabilities extend beyond standard products and use the most advanced thermal engineering resources available to design application specific products. Aavid Thermalloy solutions cool critical electronic components in computers, transportation, communications infrastructure, power supplies, motor controls, power conversion equipment, and more.

WWW.AAVIDTHERMALLOY.COM

Fluent Inc. is the worlds' largest provider of commercial CFD software and services. The company offers general-purpose CFD software for a wide range of industrial applications, along with highly-automated, application-focused packages including ICEPAK® for cooling electronics. CFD consulting services are also available worldwide. Its staff includes CFD engineers, plus experts in computational methods, mesh generation, and software development.

WWW.FLUENT.COM

Applied Thermal Technologies is the leading thermal engineering company specializing in system, board, and component level design and analysis using CFD/FEA and experimental techniques. Applied can analyze and solve all your thermal challenges. With US offices in Santa Clara, California, Richardson, Texas as well as international offices in the Pacific Rim, Applied assists companies globally. Dedicated thermal engineers characterize your system and provide the most advanced and effective cooling solutions, saving thousands in engineering resources, thermal modeling software, and test hardware..
