

Features

- **Powerful Harvard-architecture processor:**
 - M8C processor speeds up to 24 MHz
 - Low power at high speed
 - Operating voltage: 2.4 V to 5.25 V
 - Operating voltages down to 1.0 V using on-chip switch mode pump (SMP)
 - Industrial temperature range: -40 °C to +85 °C
- **Advanced peripherals (PSoC[®] blocks):**
 - Four analog type “E” PSoC blocks provide:
 - Two comparators with digital to analog converter (DAC) references
 - Single or dual 10-Bit 8-to-1 analog to digital converter (ADC)
 - Four digital PSoC blocks provide:
 - 8- to 32-bit timers, counters, and pulse width modulators (PWMs)
 - CRC and PRS modules
 - Full duplex UART, SPI[™] master or slave: Connectable to all general-purpose I/O (GPIO) pins
 - Complex peripherals by combining blocks
- **Flexible on-chip memory:**
 - 4 KB flash program storage 50,000 erase/write cycles
 - 256 bytes SRAM data storage
 - In-system serial programming (ISSP)
 - Partial flash updates
 - Flexible protection modes
 - EEPROM emulation in flash
- **Complete development tools:**
 - Free development software (PSoC Designer[™])
 - Full-featured, in-circuit emulator (ICE) and programmer
 - Full-speed emulation
 - Complex breakpoint structure
 - 128-KB trace memory
- **Precision, programmable clocking:**
 - Internal ±2.5% 24- / 48-MHz main oscillator
 - Internal low-speed, low-power oscillator for watchdog and sleep functionality
- **Programmable pin configurations:**
 - 25-mA sink, 10-mA source on all GPIOs
 - Pull-up, pull-down, high Z, strong, or open-drain drive modes on all GPIOs
 - Up to eight analog inputs on all GPIOs
 - Configurable interrupt on all GPIOs

- **Additional system resources:**
 - I²C master, slave and multi-master to 400 kHz
 - Watchdog and sleep timers
 - User-configurable low-voltage detection (LVD)
 - Integrated supervisory circuit
 - On-chip precision voltage reference

PSoC Functional Overview

The PSoC family consists of many programmable system-on-chip controller devices. These devices are designed to replace multiple traditional MCU-based system components with a low cost single-chip programmable component. A PSoC device includes configurable blocks of analog and digital logic, and programmable interconnect. This architecture allows you to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, Flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The PSoC architecture, as shown in Figure 1, consists of four main areas: the Core, the System Resources, the Digital System, and the Analog System. Configurable global bus resources allow the combining of all device resources into a complete custom system. Each PSoC device includes four digital blocks. Depending on the PSoC package, up to two analog comparators and up to 16 GPIO are also included. The GPIO provide access to the global digital and analog interconnects.

PSoC Core

The PSoC Core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and internal main oscillator (IMO), and internal low-speed oscillator (ILO). The CPU core, called the M8C, is a powerful processor with speeds up to 24 MHz. The M8C is a four MIPS 8-bit Harvard-architecture microprocessor.

System Resources provide additional capability, such as digital clocks or I²C functionality for implementing an I²C master, slave, MultiMaster, an internal voltage reference that provides an absolute value of 1.3 V to a number of PSoC subsystems, an SMP that generates normal operating voltages off a single battery cell, and various system resets supported by the M8C.

The digital system consists of an array of digital PSoC blocks, which can be configured into any number of digital peripherals. The digital blocks can be connected to the GPIO through a series of global bus that can route any signal to any pin. This frees designs from the constraints of a fixed peripheral controller.

The analog system consists of four analog PSoC blocks, supporting comparators and analog-to-digital conversion up to 10 bits of precision.

Digital System

The digital system consists of four digital PSoC blocks. Each block is an 8-bit resource that can be used alone or combined with other blocks to form 8, 16, 24, and 32-bit peripherals, which are called user modules. Digital peripheral configurations include:

- PWMs (8- to 32-bit)
- PWMs with dead band (8- to 32-bit)
- Counters (8- to 32-bit)
- Timers (8- to 32-bit)
- UART 8-bit with selectable parity (up to two)
- SPI master and slave
- I²C slave, master, multi-master (one available as a system resource)
- Cyclical redundancy checker/generator (8-bit)
- IrDA (up to two)
- Pseudo random sequence generators (8- to 32-bit)

The digital blocks can be connected to any GPIO through a series of global bus that can route any signal to any pin. The busses also allow for signal multiplexing and performing logic operations. This configurability frees your designs from the constraints of a fixed peripheral controller.

Digital blocks are provided in rows of four, where the number of blocks varies by PSoC device family. This provides an optimum choice of system resources for your application. Family resources are shown in Table 1 on page 5.

Figure 1. Digital System Block Diagram

Analog System

The analog system consists of four configurable blocks to allow creation of complex analog signal flows. Analog peripherals are very flexible and may be customized to support specific application requirements. Some of the more common PSoC analog functions (most available as user modules) are:

- Analog-to-digital converters (single or dual, with 8-bit or 10-bit resolution)
- Pin-to-pin comparators (one)
- Single-ended comparators (up to 2) with absolute (1.3 V) reference or 8-bit DAC reference
- 1.3 V reference (as a system resource)

In most PSoC devices, analog blocks are provided in columns of three, which includes one CT (continuous time) and two SC (switched capacitor) blocks. The CY8C21x23 devices provide limited functionality Type “E” analog blocks. Each column contains one CT block and one SC block.

The number of blocks on the device family is listed in [Table 1 on page 5](#).

Figure 2. CY8C21x23 Analog System Block Diagram

Additional System Resources

System resources, some of which listed in the previous sections, provide additional capability useful to complete systems. Additional resources include a switch mode pump, low voltage detection, and power on reset. The merits of each system resource are.

- Digital clock dividers provide three customizable clock frequencies for use in applications. The clocks can be routed to both the digital and analog systems. Additional clocks can be generated using digital PSoC blocks as clock dividers.
- The I²C module provides 100 and 400 kHz communication over two wires. Slave, master, and multi-master modes are all supported.
- LVD interrupts can signal the application of falling voltage levels, while the advanced POR (power on reset) circuit eliminates the need for a system supervisor.
- An internal 1.3 V voltage reference provides an absolute reference for the analog system, including ADCs and DACs.
- An integrated switch mode pump (SMP) generates normal operating voltages from a single 1.2 V battery cell, providing a low cost boost converter.

PSoC Device Characteristics

Depending on your PSoC device characteristics, the digital and analog systems can have 16, 8, or 4 digital blocks, and 12, 6, or 4 analog blocks. Table 1 lists the resources available for specific PSoC device groups. The PSoC device covered by this datasheet is highlighted.

Notes

- Limited analog functionality.
- Two analog blocks and one CapSense®.

Development Tools

PSoC Designer is a Microsoft® Windows-based, integrated development environment for the PSoC devices. The PSoC Designer IDE runs on Windows XP or Windows Vista.

This system provides design database management by project, an integrated debugger with In-Circuit Emulator, in-system programming support, and built in support for third party assemblers and C compilers.

PSoC Designer also supports C language compilers developed specifically for the devices in the PSoC family.

PSoC Designer Software Subsystems

System-Level View

A drag-and-drop visual embedded system design environment based on PSoC Express. In the system level view you create a model of your system inputs, outputs, and communication interfaces. You define when and how an output device changes state based upon any or all other system devices. Based upon the design, PSoC Designer automatically selects one or more PSoC Programmable System-on-Chip Controllers that match your system requirements.

PSoC Designer generates all embedded code, then compiles and links it into a programming file for a specific PSoC device.

Chip-Level View

The chip-level view is a more traditional integrated development environment (IDE). Choose a base device to work with and then select different onboard analog and digital components called user modules that use the PSoC blocks. Examples of user modules are ADCs, DACs, Amplifiers, and Filters. Configure the user modules for your chosen application and connect them to each other and to the proper pins. Then generate your project. This prepopulates your project with APIs and libraries that you can use to program your application.

The device editor also supports easy development of multiple configurations and dynamic reconfiguration. Dynamic configuration allows for changing configurations at run time.

Hybrid Designs

You can begin in the system-level view, allow it to choose and configure your user modules, routing, and generate code, then switch to the chip-level view to gain complete control over on-chip resources. All views of the project share a common code editor, builder, and common debug, emulation, and programming tools.

Code Generation Tools

PSoC Designer supports multiple third party C compilers and assemblers. The code generation tools work seamlessly within the PSoC Designer interface and have been tested with a full range of debugging tools. The choice is yours.

Assemblers. The assemblers allow assembly code to merge seamlessly with C code. Link libraries automatically use absolute addressing or are compiled in relative mode, and linked with other software modules to get absolute addressing.

C Language Compilers. C language compilers are available that support the PSoC family of devices. The products allow you to create complete C programs for the PSoC family devices.

The optimizing C compilers provide all the features of C tailored to the PSoC architecture. They come complete with embedded libraries providing port and bus operations, standard keypad and display support, and extended math functionality.

Debugger

The PSoC Designer Debugger subsystem provides hardware in-circuit emulation, allowing you to test the program in a physical system while providing an internal view of the PSoC device. Debugger commands allow the designer to read and program and read and write data memory, read and write I/O registers, read and write CPU registers, set and clear breakpoints, and provide program run, halt, and step control. The debugger also allows the designer to create a trace buffer of registers and memory locations of interest.

Online Help System

The online help system provides context-sensitive online help for you. Designed for procedural and quick reference, each functional subsystem has its own context-sensitive help. This system also provides tutorials and links to FAQs and an Online Support Forum to aid the designer in getting started.

In-Circuit Emulator

A low cost, high functionality in-circuit emulator (ICE) is available for development support. This hardware has the capability to program single devices.

The emulator consists of a base unit that connects to the PC by way of a USB port. The base unit is universal and operates with all PSoC devices. Emulation pods for each device family are available separately. The emulation pod takes the place of the PSoC device in the target board and performs full-speed (24 MHz) operation.

Designing with PSoC Designer

The development process for the PSoC device differs from that of a traditional fixed function microprocessor. The configurable analog and digital hardware blocks give the PSoC architecture a unique flexibility that pays dividends in managing specification change during development and by lowering inventory costs. These configurable resources, called PSoC Blocks, have the ability to implement a wide variety of user selectable functions.

The PSoC development process can be summarized in the following four steps:

1. Select components
2. Configure components
3. Organize and connect
4. Generate, verify, and debug

Select Components

Both the system-level and chip-level views provide a library of prebuilt, pretested hardware peripheral components. In the system-level view, these components are called “drivers” and correspond to inputs (a thermistor, for example), outputs (a brushless DC fan, for example), communication interfaces (I²C-bus, for example), and the logic to control how they interact with one another (called valuator).

In the chip-level view, the components are called “user modules”. User modules make selecting and implementing peripheral devices simple, and come in analog, digital, and programmable system-on-chip varieties.

Configure Components

Each of the components you select establishes the basic register settings that implement the selected function. They also provide parameters and properties that allow you to tailor their precise configuration to your particular application. For example, a PWM User Module configures one or more digital PSoC blocks, one for each 8 bits of resolution. The user module parameters permit you to establish the pulse width and duty cycle. Configure the parameters and properties to correspond to your chosen application. Enter values directly or by selecting values from drop-down menus.

Both the system-level drivers and chip-level user modules are documented in datasheets that are viewed directly in the PSoC Designer. These datasheets explain the internal operation of the component and provide performance specifications. Each datasheet describes the use of each user module parameter or driver property, and other information you may need to successfully implement your design.

Organize and Connect

You can build signal chains at the chip level by interconnecting user modules to each other and the I/O pins, or connect system level inputs, outputs, and communication interfaces to each other with valuator functions.

In the system-level view, selecting a potentiometer driver to control a variable speed fan driver and setting up the valuator to control the fan speed based on input from the pot selects, places, routes, and configures a programmable gain amplifier (PGA) to buffer the input from the potentiometer, an analog to digital converter (ADC) to convert the potentiometer’s output to a digital signal, and a PWM to control the fan.

In the chip-level view, perform the selection, configuration, and routing so that you have complete control over the use of all on-chip resources.

Generate, Verify, and Debug

When you are ready to test the hardware configuration or move on to developing code for the project, perform the “Generate Application” step. This causes PSoC Designer to generate source code that automatically configures the device to your specification and provides the software for the system.

Both system-level and chip-level designs generate software based on your design. The chip-level design provides application programming interfaces (APIs) with high level functions to control and respond to hardware events at run time and interrupt service routines that you can adapt as needed. The system-level design also generates a `C main()` program that completely controls the chosen application and contains placeholders for custom code at strategic positions allowing you to further refine the software without disrupting the generated code.

A complete code development environment allows you to develop and customize your applications in C, assembly language, or both.

The last step in the development process takes place inside the PSoC Designer’s Debugger subsystem. The Debugger downloads the HEX image to the ICE where it runs at full speed. Debugger capabilities rival those of systems costing many times more. In addition to traditional single-step, run-to-breakpoint and watch-variable features, the Debugger provides a large trace buffer and allows you define complex breakpoint events that include monitoring address and data bus values, memory locations and external signals.

Pin Information

This section describes, lists, and illustrates the CY8C21x23 PSoC device pins and pinout configurations. Every port pin (labeled with a "P") is capable of Digital I/O. However, V_{SS}, V_{DD}, SMP, and XRES are not capable of Digital I/O.

Register Reference

This section lists the registers of the CY8C21x23 PSoC device. For detailed register information, refer the [PSoC Technical Reference Manual](#).

Register Conventions

The register conventions specific to this section are listed in the following table.

Table 7. Register Conventions

Convention	Description
R	Read register or bit(s)
W	Write register or bit(s)
L	Logical register or bit(s)
C	Clearable register or bit(s)

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C21x23 PSoC device. For up to date electrical specifications, check if you have the latest datasheet by visiting the web at <http://www.cypress.com>.

Specifications are valid for $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$ and $T_J \leq 100\text{ }^{\circ}\text{C}$, except where noted.

Refer to [Table 24 on page 25](#) for the electrical specifications on the IMO using SLIMO mode.

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Table 10. Absolute Maximum Ratings

Symbol	Description	Min	Typ	Max	Units	Notes
T _{STG}	Storage temperature	-55	-	+100	°C	Higher storage temperatures reduce data retention time. Recommended storage temperature is +25 °C ± 25 °C. Extended duration storage temperatures higher than 65 °C degrade reliability.
T _{BAKETEMP}	Bake temperature	-	125	See package label	°C	
t _{BAKETIME}	Bake time	See package label	-	72	Hours	
T _A	Ambient temperature with power applied	-40	-	+85	°C	
V _{DD}	Supply voltage on V _{DD} relative to V _{SS}	-0.5	-	+6.0	V	
V _{IO}	DC input voltage	V _{SS} - 0.5	-	V _{DD} + 0.5	V	
V _{IOZ}	DC voltage applied to tristate	V _{SS} - 0.5	-	V _{DD} + 0.5	V	
I _{MIO}	Maximum current into any port pin	-25	-	+50	mA	
ESD	Electro static discharge voltage	2000	-	-	V	Human body model ESD
LU	Latch-up current	-	-	200	mA	

Operating Temperature

Table 11. Operating Temperature

Symbol	Description	Min	Typ	Max	Units	Notes
T _A	Ambient temperature	-40	-	+85	°C	
T _J	Junction temperature	-40	-	+100	°C	The temperature rise from ambient to junction is package specific. See Table 36 on page 34 . You must limit the power consumption to comply with this requirement.

DC I²C Specifications

Table 20 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, 3.0 V to 3.6 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 2.4 V to 3.0 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C and are for design guidance only.

Table 21. DC I²C Specifications^[13]

Symbol	Description	Min	Typ	Max	Units	Notes
V _{ILI2C}	Input low level	–	–	0.3 × V _{DD}	V	2.4 V ≤ V _{DD} ≤ 3.6 V
		–	–	0.25 × V _{DD}	V	4.75 V ≤ V _{DD} ≤ 5.25 V
V _{IHI2C}	Input high level	0.7 × V _{DD}	–	–	V	2.4 V ≤ V _{DD} ≤ 5.25 V

Notes

- The 50,000 cycle flash endurance per block is guaranteed if the flash is operating within one voltage range. Voltage ranges are 2.4 V to 3.0 V, 3.0 V to 3.6 V, and 4.75 V to 5.25 V.
- A maximum of 36 × 50,000 block endurance cycles is allowed. This may be balanced between operations on 36 × 1 blocks of 50,000 maximum cycles each, 36 × 2 blocks of 25,000 maximum cycles each, or 36 × 4 blocks of 12,500 maximum cycles each (and so forth to limit the total number of cycles to 36 × 50,000 and that no single block ever sees more than 50,000 cycles). For the full industrial range, you must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the application note, [Design Aids — Reading and Writing PSoC[®] Flash — AN2015](#) for more information on Flash APIs.
- All GPIO meet the DC GPIO V_{IL} and V_{IH} specifications mentioned in section [DC GPIO Specifications on page 18](#). The I²C GPIO pins also meet the mentioned specs.

Table 32. 2.7-V AC External Clock Specifications

Symbol	Description	Min	Typ	Max	Units	Notes
F _{OSCEXT}	Frequency with CPU clock divide by 1	0.093	–	6.06	MHz	Maximum CPU frequency is 3 MHz at 2.7 V. With the CPU clock divider set to 1, the external clock must adhere to the maximum frequency and duty cycle requirements.
F _{OSCEXT}	Frequency with CPU clock divide by 2 or greater	0.186	–	12.12	MHz	If the frequency of the external clock is greater than 3 MHz, the CPU clock divider must be set to 2 or greater. In this case, the CPU clock divider ensures that the fifty percent duty cycle requirement is met.
–	High period with CPU clock divide by 1	83.4	–	5300	ns	
–	Low period with CPU clock divide by 1	83.4	–	–	ns	
–	Power-up IMO to switch	150	–	–	μs	

AC Programming Specifications

Table 33 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 3.0 V to 3.6 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C and are for design guidance only.

Table 33. AC Programming Specifications

Symbol	Description	Min	Typ	Max	Units	Notes
t_{RSCLK}	Rise time of SCLK	1	–	20	ns	
t_{FSCLK}	Fall time of SCLK	1	–	20	ns	
t_{SSCLK}	Data set up time to falling edge of SCLK	40	–	–	ns	
t_{HSCLK}	Data hold time from falling edge of SCLK	40	–	–	ns	
F_{SCLK}	Frequency of SCLK	0	–	8	MHz	
t_{ERASEB}	Flash erase time (block)	–	10	–	ms	
t_{WRITE}	Flash block write time	–	80	–	ms	
t_{DSCLK3}	Data out delay from falling edge of SCLK	–	–	50	ns	$3.0 \leq V_{DD} \leq 3.6$.
t_{DSCLK2}	Data out delay from falling edge of SCLK	–	–	70	ns	$2.4 \leq V_{DD} \leq 3.0$.
$t_{ERASEALL}$	Flash erase time (bulk)	–	20	–	ms	Erase all blocks and protection fields at once.
$t_{PROGRAM_HOT}$	Flash block erase + flash block write time	–	–	180 ^[24]	ms	$0\text{ }^{\circ}\text{C} \leq T_j \leq 100\text{ }^{\circ}\text{C}$.
$t_{PROGRAM_COLD}$	Flash block erase + flash block write time	–	–	360 ^[24]	ms	$-40\text{ }^{\circ}\text{C} \leq T_j \leq 0\text{ }^{\circ}\text{C}$.

AC I²C Specifications

Table 34 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, 3.0 V to 3.6 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, or 2.4 V to 3.0 V and $-40\text{ }^{\circ}\text{C} \leq T_A \leq 85\text{ }^{\circ}\text{C}$, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C and are for design guidance only.

Table 34. AC Characteristics of the I²C SDA and SCL Pins for $V_{CC} \geq 3.0\text{ V}$

Symbol	Description	Standard Mode		Fast Mode		Units
		Min	Max	Min	Max	
F_{SCL2C}	SCL clock frequency	0	100	0	400	kHz
$t_{HDSTA2C}$	Hold time (repeated) START condition. After this period, the first clock pulse is generated.	4.0	–	0.6	–	μs
t_{LOW2C}	Low period of the SCL clock	4.7	–	1.3	–	μs
t_{HIGH2C}	High period of the SCL clock	4.0	–	0.6	–	μs
$t_{SUSTA2C}$	Setup time for a repeated START condition	4.7	–	0.6	–	μs
$t_{HDDAT2C}$	Data hold time	0	–	0	–	μs
$t_{SUDAT2C}$	Data setup time	250	–	100 ^[23]	–	ns
$t_{SUSTOI2C}$	Setup time for STOP condition	4.0	–	0.6	–	μs
t_{BUFI2C}	Bus free time between a STOP and START condition	4.7	–	1.3	–	μs
t_{SPI2C}	Pulse width of spikes are suppressed by the input filter	–	–	0	50	ns

Notes

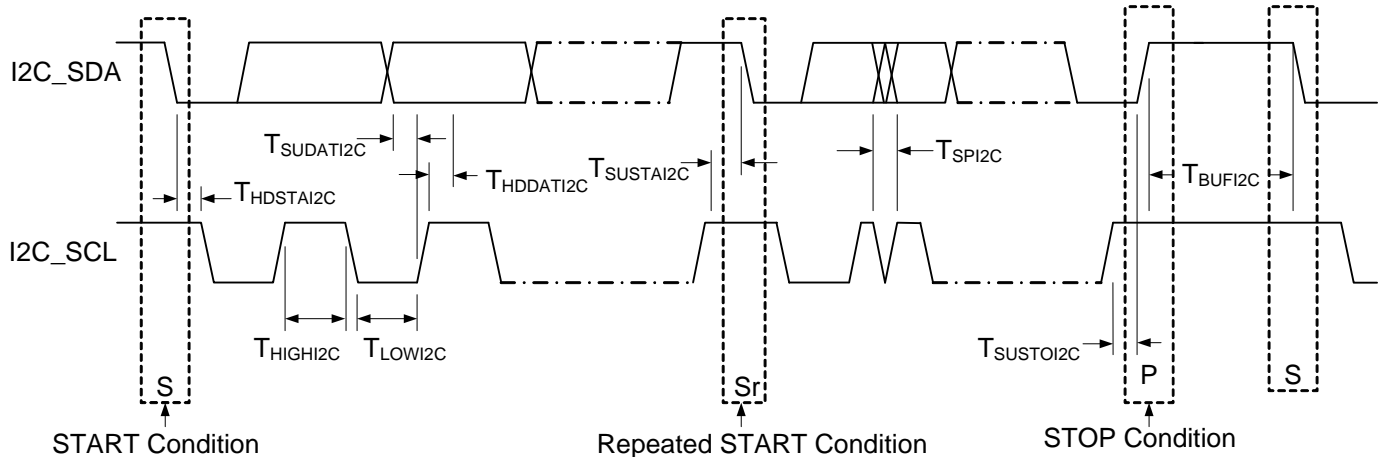

23. A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement $t_{SUDAT} \geq 250\text{ ns}$ must then be met. This automatically becomes the case if the device does not stretch the LOW period of the SCL signal. If such device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{rmax} + t_{SUDAT} = 1000 + 250 = 1250\text{ ns}$ (according to the standard-mode I²C-bus specification) before the SCL line is released.

24. For the full industrial range, you must employ a temperature sensor user module (FlashTemp) and feed the result to the temperature argument before writing. Refer to the application note, [Design Aids — Reading and Writing PSoC[®] Flash – AN2015](#) for more information on Flash APIs.

8 SOIC	260 °C	20 s
16 SOIC	260 °C	20 s
16 QFN	260 °C	20 s
20 SSOP	260 °C	20 s
24 QFN	260 °C	20 s

Notes

25. $T_J = T_A + \text{POWER} \times \theta_{JA}$

26. To achieve the thermal impedance specified for the QFN package, refer to "Application Notes for Surface Mount Assembly of Amkor's MicroLeadFrame (MLF) Packages" available at <http://www.amkor.com>.

27. Higher temperatures may be required based on the solder melting point. Typical temperatures for solder are 220+/-5 °C with Sn-Pb or 245+/-5 °C with Sn-Ag-Cu paste. Refer to the solder manufacturer specifications.

Numeric Conventions

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, '01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimals.

Glossary

active high	<ol style="list-style-type: none"> 1. A logic signal having its asserted state as the logic 1 state. 2. A logic signal having the logic 1 state as the higher voltage of the two states.
analog blocks	The basic programmable opamp circuits. These are SC (switched capacitor) and CT (continuous time) blocks. These blocks can be interconnected to provide ADCs, DACs, multi-pole filters, gain stages, and much more.
analog-to-digital (ADC)	A device that changes an analog signal to a digital signal of corresponding magnitude. Typically, an ADC converts a voltage to a digital number. The digital-to-analog (DAC) converter performs the reverse operation.
Application programming interface (API)	A series of software routines that comprise an interface between a computer application and lower level services and functions (for example, user modules and libraries). APIs serve as building blocks for programmers that create software applications.
asynchronous	A signal whose data is acknowledged or acted upon immediately, irrespective of any clock signal.
bandgap reference	A stable voltage reference design that matches the positive temperature coefficient of VT with the negative temperature coefficient of VBE, to produce a zero temperature coefficient (ideally) reference.
bandwidth	<ol style="list-style-type: none"> 1. The frequency range of a message or information processing system measured in hertz. 2. The width of the spectral region over which an amplifier (or absorber) has substantial gain (or loss); it is sometimes represented more specifically as, for example, full width at half maximum.

Glossary (continued)

bias	<ol style="list-style-type: none"> 1. A systematic deviation of a value from a reference value. 2. The amount by which the average of a set of values departs from a reference value. 3. The electrical, mechanical, magnetic, or other force (field) applied to a device to establish a reference level to operate the device.
block	<ol style="list-style-type: none"> 1. A functional unit that performs a single function, such as an oscillator. 2. A functional unit that may be configured to perform one of several functions, such as a digital PSoC block or an analog PSoC block.
buffer	<ol style="list-style-type: none"> 1. A storage area for data that is used to compensate for a speed difference, when transferring data from one device to another. Usually refers to an area reserved for IO operations, into which data is read, or from which data is written. 2. A portion of memory set aside to store data, often before it is sent to an external device or as it is received from an external device. 3. An amplifier used to lower the output impedance of a system.
bus	<ol style="list-style-type: none"> 1. A named connection of nets. Bundling nets together in a bus makes it easier to route nets with similar routing patterns. 2. A set of signals performing a common function and carrying similar data. Typically represented using vector notation; for example, address[7:0]. 3. One or more conductors that serve as a common connection for a group of related devices.
clock	The device that generates a periodic signal with a fixed frequency and duty cycle. A clock is sometimes used to synchronize different logic blocks.
comparator	An electronic circuit that produces an output voltage or current whenever two input levels simultaneously satisfy predetermined amplitude requirements.
compiler	A program that translates a high level language, such as C, into machine language.
configuration space	In PSoC devices, the register space accessed when the XIO bit, in the CPU_F register, is set to '1'.
crystal oscillator	An oscillator in which the frequency is controlled by a piezoelectric crystal. Typically a piezoelectric crystal is less sensitive to ambient temperature than other circuit components.
cyclic redundancy check (CRC)	A calculation used to detect errors in data communications, typically performed using a linear feedback shift register. Similar calculations may be used for a variety of other purposes such as data compression.
data bus	A bi-directional set of signals used by a computer to convey information from a memory location to the central processing unit and vice versa. More generally, a set of signals used to convey data between digital functions.
debugger	A hardware and software system that allows you to analyze the operation of the system under development. A debugger usually allows the developer to step through the firmware one step at a time, set break points, and analyze memory.
dead band	A period of time when neither of two or more signals are in their active state or in transition.
digital blocks	The 8-bit logic blocks that can act as a counter, timer, serial receiver, serial transmitter, CRC generator, pseudo-random number generator, or SPI.

Glossary (continued)

digital-to-analog (DAC)	A device that changes a digital signal to an analog signal of corresponding magnitude. The analog-to-digital (ADC) converter performs the reverse operation.
duty cycle	The relationship of a clock period high time to its low time, expressed as a percent.
emulator	Duplicates (provides an emulation of) the functions of one system with a different system, so that the second system appears to behave like the first system.
External Reset (XRES)	An active high signal that is driven into the PSoC device. It causes all operation of the CPU and blocks to stop and return to a pre-defined state.
Flash	An electrically programmable and erasable, non-volatile technology that provides you the programmability and data storage of EPROMs, plus in-system erasability. Non-volatile means that the data is retained when power is OFF.
Flash block	The smallest amount of Flash ROM space that may be programmed at one time and the smallest amount of Flash space that may be protected. A Flash block holds 64 bytes.
frequency	The number of cycles or events per unit of time, for a periodic function.
gain	The ratio of output current, voltage, or power to input current, voltage, or power, respectively. Gain is usually expressed in dB.
I ² C	A two-wire serial computer bus by Philips Semiconductors (now NXP Semiconductors). I2C is an Inter-Integrated Circuit. It is used to connect low-speed peripherals in an embedded system. The original system was created in the early 1980s as a battery control interface, but it was later used as a simple internal bus system for building control electronics. I2C uses only two bi-directional pins, clock and data, both running at +5V and pulled high with resistors. The bus operates at 100 kbits/second in standard mode and 400 kbits/second in fast mode.
ICE	The in-circuit emulator that allows you to test the project in a hardware environment, while viewing the debugging device activity in a software environment (PSoC Designer).
input/output (I/O)	A device that introduces data into or extracts data from a system.
interrupt	A suspension of a process, such as the execution of a computer program, caused by an event external to that process, and performed in such a way that the process can be resumed.
interrupt service routine (ISR)	A block of code that normal code execution is diverted to when the M8C receives a hardware interrupt. Many interrupt sources may each exist with its own priority and individual ISR code block. Each ISR code block ends with the RETI instruction, returning the device to the point in the program where it left normal program execution.
jitter	<ol style="list-style-type: none"> 1. A misplacement of the timing of a transition from its ideal position. A typical form of corruption that occurs on serial data streams. 2. The abrupt and unwanted variations of one or more signal characteristics, such as the interval between successive pulses, the amplitude of successive cycles, or the frequency or phase of successive cycles.
low-voltage detect (LVD)	A circuit that senses V _{DD} and provides an interrupt to the system when V _{DD} falls lower than a selected threshold.
M8C	An 8-bit Harvard-architecture microprocessor. The microprocessor coordinates all activity inside a PSoC by interfacing to the Flash, SRAM, and register space.

Glossary (continued)

master device	A device that controls the timing for data exchanges between two devices. Or when devices are cascaded in width, the master device is the one that controls the timing for data exchanges between the cascaded devices and an external interface. The controlled device is called the slave device .
microcontroller	An integrated circuit chip that is designed primarily for control systems and products. In addition to a CPU, a microcontroller typically includes memory, timing circuits, and IO circuitry. The reason for this is to permit the realization of a controller with a minimal quantity of chips, thus achieving maximal possible miniaturization. This in turn, reduces the volume and the cost of the controller. The microcontroller is normally not used for general-purpose computation as is a microprocessor.
mixed-signal	The reference to a circuit containing both analog and digital techniques and components.
modulator	A device that imposes a signal on a carrier.
noise	<ol style="list-style-type: none">1. A disturbance that affects a signal and that may distort the information carried by the signal.2. The random variations of one or more characteristics of any entity such as voltage, current, or data.
oscillator	A circuit that may be crystal controlled and is used to generate a clock frequency.
parity	A technique for testing transmitting data. Typically, a binary digit is added to the data to make the sum of all the digits of the binary data either always even (even parity) or always odd (odd parity).
Phase-locked loop (PLL)	An electronic circuit that controls an oscillator so that it maintains a constant phase angle relative to a reference signal.
pinouts	The pin number assignment: the relation between the logical inputs and outputs of the PSoC device and their physical counterparts in the printed circuit board (PCB) package. Pinouts involve pin numbers as a link between schematic and PCB design (both being computer generated files) and may also involve pin names.
port	A group of pins, usually eight.
Power on reset (POR)	A circuit that forces the PSoC device to reset when the voltage is lower than a pre-set level. This is one type of hardware reset.
PSoC [®]	Cypress Semiconductor's PSoC [®] is a registered trademark and Programmable System-on-Chip [™] is a trademark of Cypress.
PSoC Designer [™]	The software for Cypress' Programmable System-on-Chip technology.
pulse width modulator (PWM)	An output in the form of duty cycle which varies as a function of the applied measurand
RAM	An acronym for random access memory. A data-storage device from which data can be read out and new data can be written in.
register	A storage device with a specific capacity, such as a bit or byte.
reset	A means of bringing a system back to a know state. See hardware reset and software reset.
ROM	An acronym for read only memory. A data-storage device from which data can be read out, but new data cannot be written in.

Glossary (continued)

serial	<ol style="list-style-type: none"> 1. Pertaining to a process in which all events occur one after the other. 2. Pertaining to the sequential or consecutive occurrence of two or more related activities in a single device or channel.
settling time	The time it takes for an output signal or value to stabilize after the input has changed from one value to another.
shift register	A memory storage device that sequentially shifts a word either left or right to output a stream of serial data.
slave device	A device that allows another device to control the timing for data exchanges between two devices. Or when devices are cascaded in width, the slave device is the one that allows another device to control the timing of data exchanges between the cascaded devices and an external interface. The controlling device is called the master device.
SRAM	An acronym for static random access memory. A memory device where you can store and retrieve data at a high rate of speed. The term static is used because, after a value is loaded into an SRAM cell, it remains unchanged until it is explicitly altered or until power is removed from the device.
SROM	An acronym for supervisory read only memory. The SROM holds code that is used to boot the device, calibrate circuitry, and perform Flash operations. The functions of the SROM may be accessed in normal user code, operating from Flash.
stop bit	A signal following a character or block that prepares the receiving device to receive the next character or block.
synchronous	<ol style="list-style-type: none"> 1. A signal whose data is not acknowledged or acted upon until the next active edge of a clock signal. 2. A system whose operation is synchronized by a clock signal.
tri-state	A function whose output can adopt three states: 0, 1, and Z (high-impedance). The function does not drive any value in the Z state and, in many respects, may be considered to be disconnected from the rest of the circuit, allowing another output to drive the same net.
UART	A UART or universal asynchronous receiver-transmitter translates between parallel bits of data and serial bits.
user modules	Pre-build, pre-tested hardware/firmware peripheral functions that take care of managing and configuring the lower level Analog and Digital PSoC Blocks. User Modules also provide high level API (Application Programming Interface) for the peripheral function.
user space	The bank 0 space of the register map. The registers in this bank are more likely to be modified during normal program execution and not just during initialization. Registers in bank 1 are most likely to be modified only during the initialization phase of the program.
V_{DD}	A name for a power net meaning "voltage drain." The most positive power supply signal. Usually 5 V or 3.3 V.
V_{SS}	A name for a power net meaning "voltage source." The most negative power supply signal.
watchdog timer	A timer that must be serviced periodically. If it is not serviced, the CPU resets after a specified period of time.

*C	227321	CMS Team	See ECN	Update specs., data, format.
*D	235973	SFV	See ECN	Updated Overview and Electrical Spec. chapters, along with 24-pin pinout. Added CMP_GO_EN register (1,64h) to mapping table.
*E	290991	HMT	See ECN	Update datasheet standards per SFV memo. Fix device table. Add part numbers to pinouts and fine tune. Change 20-pin SSOP to CY8C21323. Add Reflow Temp. table. Update diagrams and specs.
*F	301636	HMT	See ECN	DC Chip-Level Specification changes. Update links to new CY.com Portal.
*G	324073	HMT	See ECN	Obtained clearer 16 SOIC package. Update Thermal Impedances and Solder Reflow tables. Re-add pinout ISSP notation. Fix ADC type-o. Fix TMP register names. Update Electrical Specifications. Add CY logo. Update CY copyright. Make datasheet Final.
*H	2588457	KET/HMI/AESA	10/22/2008	New package information on page 9. Converted datasheet to new template. Added 16-Pin OFN package diagram.
*I	2618175	OGNE/PYRS	12/09/08	Added Note in Ordering Information Section. Changed title from PSoC Mixed-Signal Array to PSoC Programmable System-on-Chip. Updated 'Development Tools' and 'Designing with PSoC Designer' sections on pages 5 and 6
*J	2682782	MAXK/AESA	04/03/2009	Corrected 16 COL pinout.
*K	2699713	MAXK	04/29/09	Minor ECN to correct paragraph style of 16 COL Pinout. No change in content.
*L	2762497	JVY	09/11/2009	Updated DC GPIO, AC Chip-Level, and AC Programming Specifications as follows: Modified F _{IMO6} and T _{WRITE} specifications. Replaced T _{RAMP} time) specification with SR _{POWER_UP} (slew rate) specification. Added note [11] to Flash Endurance specification. Added I _{OH} , I _{OL} , DC _{ILO} , F _{32K_U} , T _{POWERUP} , T _{ERASEALL} , T _{PROGRAM_HOT} , and T _{PROGRAM_COLD} specifications..
*M	2792630	TTO	10/26/2009	Updated ordering information for CY8C21223-24LGXI to indicate availability of XRES pin.
*N	2901653	NJF	03/30/2010	Changed 16-pin COL to 16-pin QFN in the datasheet. Added Contents . Updated links in Sales, Solutions, and Legal Information Updated Cypress website links. Added T _{BAKETEMP} and T _{BAKETIME} parameters in Absolute Maximum Ratings Updated 5-V and 3.3-V AC Chip-Level Specifications Updated Notes in Packaging Information and package diagrams. Updated Ordering Code Definitions
*O	2928895	YJI	05/06/2010	No technical updates. Included with EROS spec.
*P	3044869	NJF	10/01/2010	Added PSoC Device Characteristics table . Added DC I ² C Specifications table. Added F _{32K_U} max limit. Added T _{jitter_IMO} specification, removed existing jitter specifications. Updated Units of Measure, Acronyms, Glossary, and References sections. Updated solder reflow specifications. No specific changes were made to AC Digital Block Specifications table and I ² C Timing Diagram. They were updated for clearer understanding. Updated Figure 13 since the labelling for y-axis was incorrect. Template and styles update.
