

## GENERAL DESCRIPTION

This document describes specifications for the F1650NLGI Zero/Complex IF Modulator implementing Zero-Distortion™ technology for low power consumption with improved ACLR. This device interfaces directly to a high performance Tx dual DAC.

## COMPETITIVE ADVANTAGE

In typical multi-mode, multi-carrier basestation transmitters the modulator has limited linearity and high power consumption which penalizes the system ACLR and system Power consumptions budgets in a Digital-Pre-Distortion environment.

The IDTF1650 is designed to eliminate these penalties by embedding Zero-Distortion™ technology into the device such that very high IP3 and IP2 are achieved with minimal current draw.

- Power consumption ↓**45%**
- IM3 Distortion ↓**12 dB**

## PART# MATRIX

Part#	RF freq Range	IP2 <sub>o</sub>	Power Cons.	IP3 <sub>o</sub>	Noise
F1650	600 – 2400	+60 dBm	587 mW	+36 dBm	-158 dBm/Hz

## FEATURES

- Power Gain = 3.25dB
- Direct 100Ω differential drive from Tx DAC
- **< 590mW Power Consumption @ 2GHz**
- -158dBm/Hz Output Noise
- IP2<sub>o</sub> = +60dBm @ 2GHz
- **IP3<sub>o</sub> = +36dBm @ 2GHz**
- Excellent native LO and image suppression
- 600 MHz input 1dB Bandwidth
- 600 MHz to 2400MHz RF BW
- **Constant LO impedance when OFF**
- 3.3V Single Power Supply
- LO port can be driven single ended or differential
- 4mm x 4mm 24-pin TQFN package

## ABSOLUTE MAXIMUM RATINGS

VDD to GND	-0.3V to +3.6V
STBY	-0.3V to (VDD + 0.3V)
BB_I+, BB_I-, BB_Q+, BB_Q-	-0.3V to 1.8V
LO_IN	-0.3V to 0.3V
RF_OUT	(VDD-0.35V) to (VDD-0.05V)
Continuous Power Dissipation	1.5W
$\theta_{JA}$ (Junction – Ambient)	+45°C/W
$\theta_{JC}$ (Junction – Case) The Case is defined as the exposed paddle	+2.5°C/W
Operating Temperature Range (Case Temperature)	$T_{CASE} = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+260°C

*Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability*

## TYPICAL OPERATING CONDITIONS

Unless otherwise noted, the following conditions apply:

- Baseband I&Q levels = 200 mV<sub>PP</sub> each (-13 dBm / Channel / Tone)
- Baseband I&Q tones = 49, 50 MHz
- Low Side Injection
- T<sub>AMB</sub> = 25C, V<sub>CC</sub> = 3.30 V, LO Power = 0 dBm where T<sub>AMB</sub> is the ambient temperature
- V<sub>CM</sub> = 0.250 Volts, where CM is common mode
- Flo = 1.95GHz unless otherwise specified, where lo is Local Oscillator
- EVKit RF output Trace and Connector Losses De-Embedded

## PIN DESCRIPTIONS

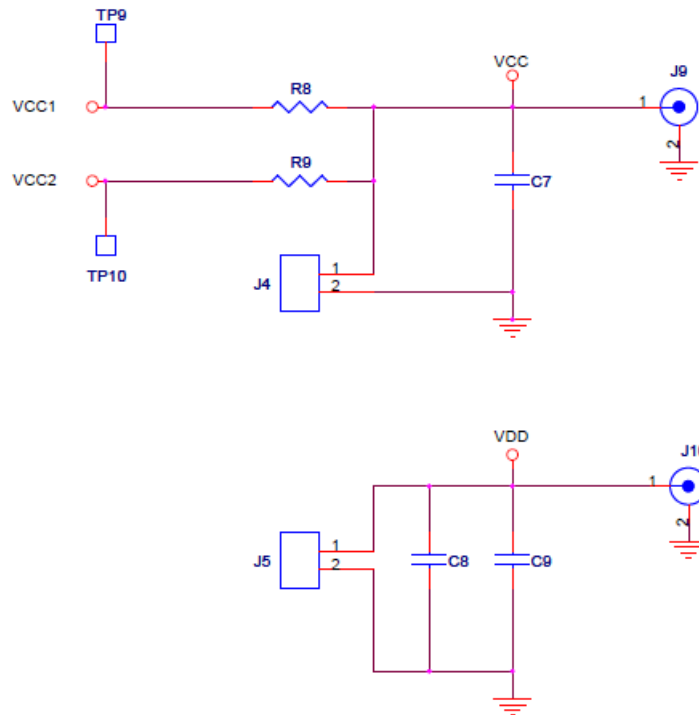

Pins	Name	Function
1	STBY	STBY Mode. Pull this pin high for Standby Mode (<15 mA). Pull low or ground for Normal Operation.
2, 5, 8, 12, 13, 19, 23	GND	Ground these pins.
11, 14, 15, 17, 20	NC	IDT recommends to ground these pins.
3, 4	LO+, LO-	Local oscillator (LO) 50 ohm differential or 25ohm each pin single-ended input. Pins should be ac-coupled. For 50 ohm single-ended operation, ac-couple USED Pin to 50 ohm termination and ac-couple UNUSED pin to GND.
6	TEST	Test pin. Ground this pin.
7	R_DIST	Connect the specified resistor from this pin to ground to set the RF distortion amplifier current.
9, 10	BB_Q-, BB_Q+	<i>Quadrature</i> differential baseband input. Internally matched to 100 ohms.
16	RF_OUT	RF output. Must be ac-coupled.
18, 24	VDD	Power Supply. Bypass to GND with capacitors as shown in the Typical Application Circuit as close to pin as possible.
21, 22	BB_I+, BB_I-	<i>In-Phase</i> differential baseband input. Internally matched to 100 ohms.
	— EP	Exposed Pad. Internally connected to GND. Solder this exposed pad to a PCB pad that uses multiple ground vias to provide heat transfer out of the device into the PCB ground planes. These multiple via grounds are also required to achieve the specified RF performance.

## EVKIT SCHEMATIC

## EVKIT SCHEMATIC (CONTINUED)

## POWER SUPPLIES

All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than  $1V/20\mu s$ . In addition, all control pins should remain at 0V ( $\pm 0.3V$ ) while the supply voltage ramps or while it returns to zero.

## APPLYING $V_{CM}$ AT THE BASEBAND INPUTS

With L1, L2, L3, and L4 unpopulated, the common mode voltage is set by VR2 and VR4. The voltage set by VR2 has a DC path through the balun transformer T1 to pins BB\_I+ and BB\_I-, as highlighted. This also applies for VR4, T2, and pins BB\_Q+ and BB\_Q-. With this configuration, the same voltage will be applied to BB\_I+ and BB\_I- and the same voltage will be applied to BB\_Q+ and BB\_Q-. The I and Q common mode voltages may be different from each other to null LO (carrier) leakage.
